## OMRON

## CJ Series Programmable Controllers

CJ1G-CPU P Loop-control CPU Unit

## CJ1 Special I/O Units

Process Analog Input Units (Isolated Units with Fully Universal Inputs) CJ1W-PH41U (High-resolution Unit) and CJ1W-AD04U (General-purpose Unit)

## Fully Integrated Sequence and Loop Control New Built-in Loop Controller

realrzing

Introducing the New Style of Loop Control Advanced controller functions integrated with the same CJ-series functionality and high-speed capabilities

> Downsizing

- Ultra-small size fits in most devices
- Backplane-free structure provides the functions you need in minimum space.
- Low-cost solution for controlling multiple loops

 Function block programming for easy engineering

- Seamless integration of sequence control and loop control.
- HMI windows can be simply generated from function blocks automatically.

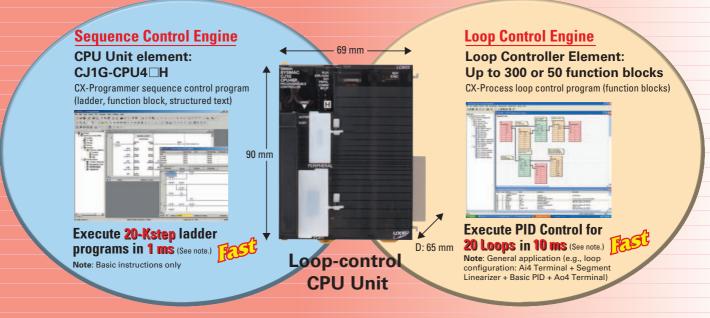

SMARTPROCESS CONTROL

Easy Engineering  Control functions have the added ability to control multiple loops.
 Consolidating the proven CSseries loop-control technology
 Effective maintenance functions

High Reliability

## **Integrated Loop Control and Sequence Control**

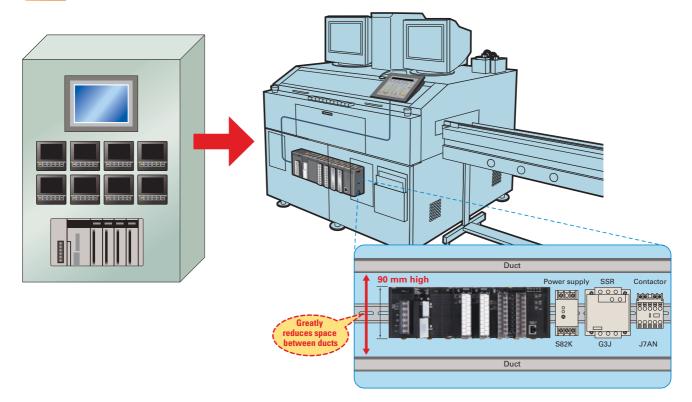

An engine for controlling analog quantities (e.g., temperature, pressure, flowrate) is built into the CPU Unit together with the engine for executing sequence control, delivering high-speed sequence control and high-speed, advanced analog quantity control in a single Unit.

# Down-sizing

## Super compact: Only 90 mm High and 65 mm Deep, and Backplane-free structure enables flexible width design.

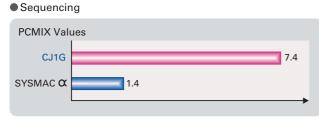

Compact PLC Aids Machine Downsizing by Fitting Just About Anywhere. Wide Array of I/O Units, Special I/O Units, and CPU Bus Units Are Available to Suit Your Application.

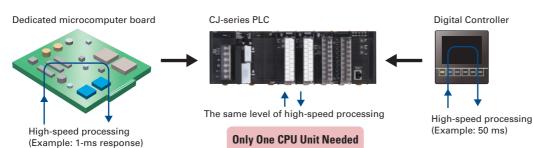

High-speed sequence control functions can be used directly for high-speed, advanced loop control.

• Sequence control: Executes 20-Kstep ladder programs in 1 ms (with basic instructions only). PCMIX = 7.4 LD or OUT executed in 40 ns

• Loop control: Executes PID operations for 20 loops in up to 10 ms. This is a guide for general applications. (See note.)

Note: Loop configuration: Ai4 Terminal + Segment Linearizer + Basic PID + Ao4 Terminal The external I/O response time in the overall system refers to the conversion time.

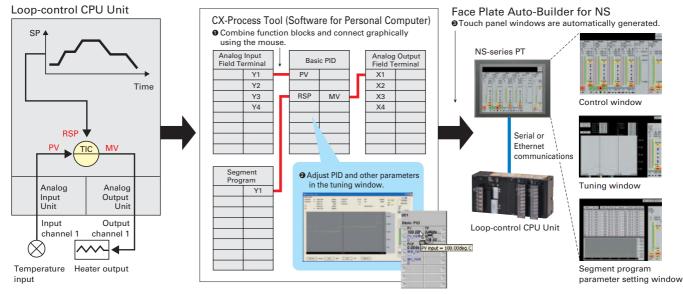

# Easy Engineering

Function blocks make loop-control programming easy. You can also create CX-Process Tool tuning windows to help adjust loops. Controller faceplates can be created automatically for touch panel displays.

- Sequence control programs: Standardize and simplify programs using structured programming. Special I/O
  Unit and CPU Bus Unit settings are easy with function blocks (using ladder programming language or
  structured text).
- Loop control programs: By combining function blocks, a wide array of control methods can be easily configured, from basic PID control used by Temperature Controllers to program, cascade, and feed-forward control. Easily display values, such as temperatures, in engineering units, allowing you to check operation.

• Engineering Example: Program Control

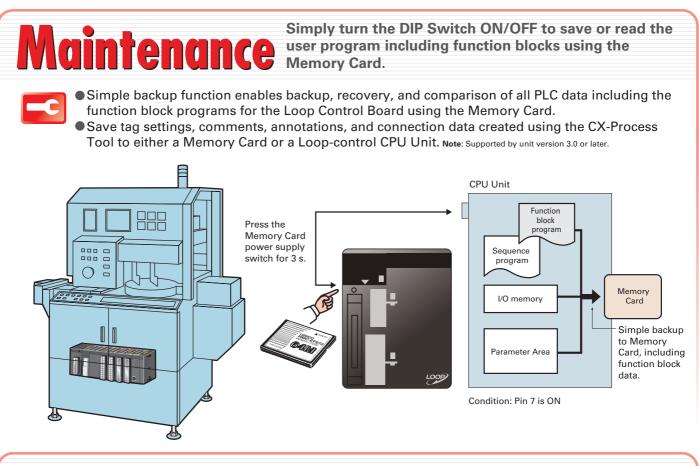

Lineup includes low-cost models that use up to 50 function blocks and models that allow up to 300 blocks designed for large-scale systems and complicated operations.

• Loop control: Programming with function blocks to suit the application. System configuration: Choose and combine functions from a broad selection of I/O Units. Process Input Units, Analog I/O Units, etc. System Configuration Perform Control output Read data from Perform PID heating/cooling Analog Input Units from Analog control control Output Unit **Click Click Click** Analog Input Field Terminal Analog Output Field Terminal Basic PID Split Conversion **Y**1 PV SP Y1 X1 10 Units max Expansion Rack Y2 DV X2 Y3 RSP MV ХЗ Y4 X4 X5 Y5 Y6 X6 ノル Expansion 10 Units max. ## liab β

Consolidating OMRON's expertise in temperature and process control cultivated over many years to provide you with effortless solutions using proven algorithms.

• Loop control: Proven functionality of Temperature Controllers and CS-series Loop Control Boards (see note 1) in a compact size.

#### New Algorithm Further Enhances Control Stability

## **Disturbance Overshoot Adjustment**

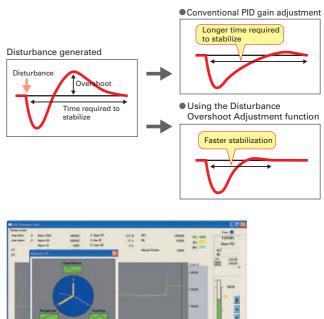

This function restrains overshoot when a disturbance is generated, allowing faster stabilization. [Example]

- Temperature drops when adding objects to a furnace
- · Control disturbances when retooling

#### Optimum Tuning to Suit the Application Fine Tuning

Adjust PVs, SPs, and MVs while monitoring, and save data as CSV files from the software tuning window. Autotuning (AT) and fine-tuning functions can also be used for automatically calculating PID constants (see note 2).

- Note 1: For details on CS-series Loop Control Boards, refer to the PLC-based Process Control Catalog (Cat. No. P051).
  - 2: Control can be fine-tuned by automatically tuning PID parameters using previous control parameters and three user-set requirements to execute fuzzy logic.

TIMIN

## **Applications**

The Loop-control CPU Unit Provides You with Solutions for the Complex and Advanced Functions Demanded by Control Devices in an Increasingly Diverse Range of Equipment.

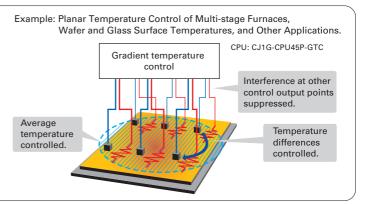

#### • Gradient Temperature Control for Planar Temperature Control Across Multiple Points

Note: CJ1G-CPU45P-GTC only.

Gradient temperature control equalizes the temperatures at multiple points, providing high-quality heat processing, reducing energy loss until temperatures stabilize, and saving labor in adjustments due to interference between heaters.

For details, refer to the SYSMAC CS/CJ Series Controllers for Gradient Temperature Control Catalog (R141).

#### Providing Solutions to Other Problems

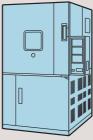

Electrical parts equipment requiring high-speed temperature control for higher precision and improved tact time.

Diffusion furnaces that perform cascade control of heater temperatures and internal chamber temperatures.

00

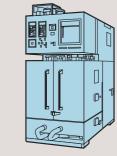

ontrol conductor devices and tures other machines requiring ber multipoint temperature control.

Food machines, semi-

Fermentation equipment requiring temperature, pressure, flowrate, and pH control.

Testing devices that frequently change setting conditions and program settings.

## **Loop Control Machines and Product Variations**

#### Model Selection

Compact CJ-series Loop-control CPU units are ideal for equipment with built-in applications. CS-series and CS1D models designed for duplex systems are also available for processing equipment that requires high reliability.

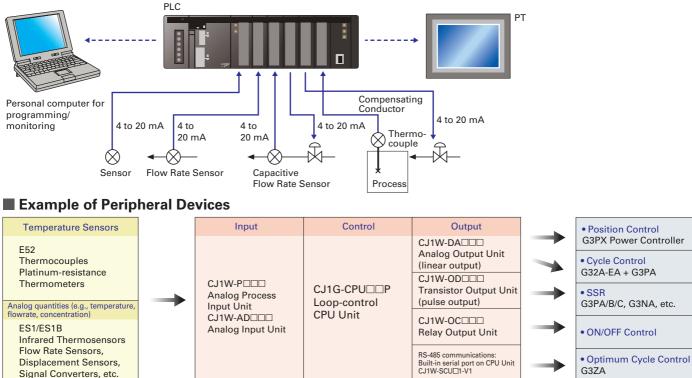

Note 1: The Temperature Control Unit integrates control and I/O for either 2 loops or 4 loops. Temperature control is achieved simply by setting parameters. (CX-Process cannot be used.)

2: For details on CS-series Loop Control Boards and Process-control CPU Units, refer to the PLC-based Process Control Catalog (Cat. No. P051).

#### System Configuration Example

Displacement Sensors,

Signal Converters, etc.

G3ZA

## **Peripheral Devices**

#### **Input Devices**

## **E52-series Temperature Controllers**

Plenty of Variation to Suit an Extensive Range of Applications

- Select from a variety of choices in number of elements, shape, protective tubing length, and terminal type.
- •Economical models and special models are available as well as generalpurpose models. Select from a diverse range of models to suit the application: Models for high temperatures, metal patterns, surface measurement, and room temperatures, waterproof and anti-corrosive models, models for moving parts, and models with double elements.

#### Model Structure

E52-(1)(2)(3) D=(4) (5) M

Example: E52-CA15A D:3.2 2M

① Element type ④ Protective tubing model 2 Protective tubing length 5 Lead wire length ③ Terminal type

**ES1/ES1B-series Infrared Thermosensors** 

Hygienic temperature measurement without damaging the workpiece. Ideal for workpieces on conveyors or other applications in which contact measurement is difficult.

- •ES1 Series: Designed for high-precision, small-spot, high-temperature measurements.
- •Two types of small spot: 3-mm dia. and 8-mm dia.
- High-precision and high-speed measurement with a repeatability of ±0.5 C and response speed of 0.4 s (95%).
- Models are available for medium (-500 to 500 C), mid-low (-50 to 500 C), and high (0 to 1000 C) temperature ranges.

## **Output Devices**

## G3PF Solid-state Relay with Built-in **Current Transformer (CT)**

Built-in current transformer is provided and heater burnouts and SSR shortcircuits can be detected.

- Built-in current transformer reduces wiring work.
- Detects the burnout of any one of multiple heaters.
- Detects burnouts in 3-phase heaters.
- Detects SSR short-circuits.
- •Error detection level can be easily set with a switch.
- Can be mounted to a DIN Track or with screws.
- •Three types of input terminals are available: M3 terminals, screwless clamp terminals (detachable), or compact slotted terminals (detachable).

## G3ZA Multi-channel Power Controller

Optimum Cycle Control for High-precision Control with Low Noise Smaller than power conditioners.

- Power control with little noise is enabled by combining the Power Controller with zero-cross SSRs. (See note.)
- One Controller can control up to 8 SSRs.
- •RS-485 communications can be used to set output values and heater burnout detection.
- •The G3ZA Smart FB Library is also available.
- •A soft-start function that can be used for lamp heaters has been added. (See note.)
- A 3-phase optimum cycle control function has been added for use with 3-cycle heaters.
- Detection of 150-A currents has been added along with a special current transformer. Note: Non-zero-cross SSRs must be used in combination with the soft-start function.

## **New Products**

## CJ1W-PH41U Process Analog I/O Unit (High-resolution Unit with Fully Universal Inputs)

#### CJ1W-AD04U Process Analog I/O Unit (General-purpose Unit with Fully Universal Inputs)

A single Unit handles all types of inputs, including temperature sensor inputs (e.g., thermocouple or platinum resistance thermometer), analog signal inputs (e.g., 4 to 20 mA or 1 to 5 V), and potentiometer inputs.

#### • Fully Universal Inputs, Including Thermocouple Inputs, Platinum Resistance Thermometer Inputs, and DC/Voltage Inputs

The input type can be selected for each input channel, saving space and reducing costs for compact devices that use a mix of input types. And trouble-free selection of input types improves inventory control and maintenance.

#### General-purpose Models for Great Cost Performance and High-resolution Models for Applications Such as Semiconductor Production Equipment

These compact CJ-series Units provide four isolated input channels per Unit. Depending on the application, choose either the high-resolution CJ1W-PH41U, which provides a selection of combinations of resolutions and conversion speeds in addition to a PLC-first 1/1,000 C range (0.000 to 50.000 C, 4-wire Pt100), or the general-purpose CJ1W-AD04U, which provides superior cost performance. (See note.)

Note: According to OMRON investigation.

Resolutions and Sampling Speeds for High-resolution Models

|            | Fuzzy Logic<br>(See note 2.)                | Outputs up to 2 analog outputs based on<br>fuzzy logic performed on up to 8 analog<br>inputs.   |
|            | Indication and Setting (See note 1.)        | Manual setter with PV indication and SP setting functions   |
|            | Indication and Opera-<br>tion (See note 1.) | Manual setter with PV indication and MV setting functions   |
|            | Ratio Setting<br>(See note 1.)              | Ratio and bias setter with PV indication and ratio setting function   |
|            | Indicator<br>(See note 1.)                  | PV indicator with PV alarm  |

Note: 1. The Function Blocks dealing with high-speed operation (operation cycle: 0.01, 0.02, and 0.05 seconds is possible).

 $\textbf{2.} \ \ \text{Cannot} \ \text{be used} \ \text{with the CJ1G-CPU45P-GTC}.$ 

## **Operation Blocks**

| Town                                  | Dia da Nama  |  |
|---------------------------------------|--|--|
| Type                                  | Block Name   | Function   |
| Alarm/Signal<br>restrictions/<br>Hold | High/Low Alarm<br>(See note 1.)                          | Provides the alarm contact outputs for the high and low limits of single analog signals.   |
|                                       | Deviation Alarm<br>(See note 1.)                         | Provides the alarm contact outputs for the devia-<br>tion of two analog signals.   |
|                                       | Rate-of-change Opera-<br>tion and Alarm<br>(See note 1.) | Provides the alarm contact outputs for the high<br>and low limits of rate-of-change operation when<br>the analog signal rate-of-change is output.                        |
|                                       | High/Low Limit<br>(See note 1.)                          | Limits the high and low limits of single analog signals.   |
|                                       | Deviation Limit<br>(See note 1.)                         | Calculates the deviation between two analog signals, and limits the deviation within that range.   |
|                                       | Analog Signal Hold<br>(See note 1.)                      | Holds the maximum, minimum or instantaneous value of single analog signals.  |
| Arithmetic                            | Addition or Subtraction (See note 1.)                    | Performs addition/subtraction with gain and bias<br>on up to 4 analog signals.   |
|                                       | Multiplication<br>(See note 1.)                          | Performs multiplication with gain and bias on up to 2 analog signals.  |
|                                       | Division (See note 1.)                                   | Performs division with gain and bias on up to 2 analog signals.  |
|                                       | Arithmetic Operation<br>(See note 1.)                    | Performs various math operation (trigonometric,<br>logarithmic, etc.) on floating-point decimal values<br>converted (to industrial units) from up to 8 analog<br>inputs. |
|                                       | Range Conversion<br>(See note 1.)                        | Easily converts up to 8 analog signals simply by inputting the 0% and 100% input values and 0% and 100% output values.   |
| Functions                             | Square Root<br>(See note 1.)                             | Performs square root extraction (with low end cutout) on single analog signals.  |
|                                       | Absolute Value<br>(See note 1.)                          | Outputs the absolute value of single analog sig-<br>nals.  |
|                                       | Non-linear Gain<br>(Dead Band)<br>(See note 1.)          | Performs non-linear (3 gain values) operation on<br>single analog signals. Analog signals can also set<br>as a dead band (with different gap).                           |
|                                       | Low-end Cutout<br>(See note 1.)                          | Sets output to zero close to the zero point of single analog signals.  |
|                                       | Segment Linearizer<br>(See note 1.)                      | Converts single analog signals to 15 segments before the signals are output.   |
|                                       | Temperature and<br>Pressure Correction<br>(See note 1.)  | Performs temperature and pressure correction.  |
| Time Function                         | First-order Lag<br>(See note 1.)                         | Performs first-order lag operation on single analog signals.   |
|                                       | Rate-of-change Limit<br>(See note 1.)                    | Performs rate-of-change restriction on single<br>analog signals.   |
|                                       | Moving Average<br>(See note. 1)                          | Performs moving average operation on single<br>analog signals.   |
|                                       | Lead/Delay (See note 1.)                                 | Performs lead/delay operation on single analog signals.  |
|                                       | Dead Time (See note 1.)                                  | Performs dead time and first-order lag operations<br>on single analog signals.   |
|                                       | Dead Time Compensa-<br>tion                              | Used for Smith's dead time compensation PID control.   |
|                                       | Accumulator for instanta-<br>neous value input           | Accumulates analog signals, and outputs 8-digit accumulated value signals.   |
|                                       | Run Time Accumulator                                     | Accumulates the operating time, and outputs the pulse signal per specified time.   |
|                                       | Time Sequence Data<br>Statistics (See note 1.)           | Records time sequence data from analog signals<br>and calculates statistics, such as averages and<br>standard deviations.  |
|                                       | Ramp Program   | Ramp program setter for combining ramps for time and hold values.  |
|                                       | Segment Program  | Segment program setter setting the output values<br>with respect to time.  |
|                                       | Segment Program 2  | Segment program setting with wait function for   |
|                                       | Segment Program 3  | setting the output values with respect to time.  |

## List of Function Blocks

| Туре                            | Block Name                                    | Function  |
|---------------------------------|---|---|
| Signal Selec-<br>tion/Switching | Rank Selector<br>(See note 1.)                | Selects the rank of up to 8 analog signals.   |
|                                 | Input Selector<br>(See note 1.)               | Selects the specified analog signals specified by the contact signal from up to 8 analog signals.   |
|                                 | 3-input Selector<br>(See note 1.)             | Selects and outputs one of three analog input signals.  |
|                                 | 3-output Selector<br>(See note 1.)            | Outputs one analog input signal in three switched directions.   |
|                                 | Constant Selector<br>(See note 1.)            | Selects 8 preset constants by the contact signal.   |
|                                 | Constant Generator<br>(See note 1.)           | Outputs 8 independent constants.  |
|                                 | Ramped Switch                                 | Switches two analog inputs (or constants) with a ramp.  |
|                                 | Bank Selector                                 | Records the PID parameters (SP, P, I, D, MH,<br>ML) in up to 8 sets in advance, and switches the<br>PID parameter for Basic/Advanced/Blended PID<br>Blocks according to the analog input range<br>(zone) or input bits.   |
|                                 | Split Converter                               | Inputs the MV from the Basic PID block or Ad-<br>vanced PID block, converts the MV into two<br>analog outputs for V characteristics or parallel<br>characteristics (e.g., MV for heating or cooling)<br>and outputs them. |
| Constant<br>ITEM Setting        | Constant ITEM Setting (See note 1.)           | Writes the constant to the specified ITEM at the rising edge of the send command contact.   |
|                                 | Variable ITEM Setting<br>(See note 1.)        | Writes the analog signal to the specified ITEM at the rising edge of the send command contact.  |
|                                 | Batch Data Collector (See note 1.)            | Stores each of max. 8 analog inputs to buffer by a certain timing within sequential processing.   |
| Pulse Train<br>Operation        | Accumulated Value In-<br>put Adder            | Adds up to four accumulated value signals.  |
|                                 | Accumulated Value An-<br>alog Multiplier      | Multiplies analog signals by the accumulated value signals.   |
|                                 | Accumulator for accu-<br>mulated value input  | Converts 4-digit accumulated value signals to 8 digits.   |
|                                 | Contact input/Accumu-<br>lated value output   | Counts low-speed contact pulses, and outputs 8-digit accumulated signals.   |
|                                 | Accumulated Value In-<br>put/Contact Output   | Converts 4-digit accumulated value signals to<br>low-speed contact pulses before they are output.   |
| Others                          | Analog/Pulse Width<br>Converter (See note 1.) | Changes the ON/OFF duration ratio in a constant<br>cycle duration so that it is proportional to the<br>analog signal.   |
| Sequence<br>Operation           | Contact Distributor                           | Connect contact signals between function blocks in a 1:1 connection.  |
|                                 | Constant Comparator<br>(See note 1.)          | Compares up to eight sets of analog signals and<br>constants, and outputs the comparison results as<br>contacts.  |
|                                 | Variable Comparator (See note 1.)             | Compares up to eight pairs of analog signals,<br>and outputs the comparison results as contacts.  |
|                                 | Timer (See note 1.)                           | 2-stage output type addition timer for forecast<br>values and reached values. Can also output the<br>present value.   |
|                                 | ON/OFF Timer<br>(See note 1.)                 | Timer for performing ON-OFF operation at preset<br>ON and OFF times.  |
|                                 | Clock Pulse<br>(See note 1.)                  | Outputs a clock pulse at the setting time interval<br>for a single operation cycle.   |
|                                 | Counter (See note 1.)                         | 2-stage output type addition timer for forecast values and arrival values. Can also output the current value.   |
|                                 | Internal Switch<br>(See note 1.)              | Temporary storage contact for accepting relays<br>in the Step Ladder Program block.<br>Note: (One internal switch is already allocated<br>as "temporary storage" in CX-Process<br>Tool.)                                  |
|                                 | Level Check<br>(See note 1.)                  | Checks an analog input for 8 levels and outputs<br>a contact corresponding to the level. The level<br>number is also output as an analog value at the<br>same time.   |
| Contact Type<br>Control Tar-    | ON/OFF Valve Manipu-<br>lator                 | Manipulates and monitors ON/OFF valves with<br>open/close limit switches.   |
| get                             | Motor Manipulator                             | Manipulates and monitors motor operation.   |
|                                 | Reversible Motor Manip-<br>ulator             | Manipulates and monitors reversible motor<br>operation.   |
|                                 | Motor Opening Manipu-<br>lator                | Inputs a target opening, and manipulates an<br>electric positional-proportional motor.  |
|                                 | Switch Meter<br>(See note 2.)                 | Manipulates and monitors multiple (up to 8) devices such as ON/OFF valves, motors, or pumps.  |

## **Sequence Control**

| Туре | Block Name | Function   |
|------|------------|--|
|      |            | Performs logic sequence and step pro-<br>gression control. |

Note: The Function Blocks dealing with high-speed operation (operation cycle: 0.01, 0.02, and 0.05 seconds is possible).

## **Field Terminals**

| Туре                      | Block Name                                | Function  |
|---------------------------|---|---|
| Contact                   | DI 8-point Terminal                       | Inputs 8 contacts from 8-point Input Unit.  |
| I/O<br>(See note.)        | DI 16-point Terminal                      | Inputs 16 contacts from 16-point Input<br>Unit.   |
|                           | DI 32-point Terminal                      | Inputs 32 contacts from 32-point Input<br>Unit.   |
|                           | DI 64-point Terminal                      | Inputs 64 contacts from 64-point Input<br>Unit.   |
|                           | DO 8-point Terminal                       | Outputs 8 contacts from 8-point Output Unit.  |
|                           | DO 16-point Termi-<br>nal                 | Outputs 16 contacts from 16-point Output Unit.  |
|                           | DO 32-point Termi-<br>nal                 | Outputs 32 contacts from 32-point Output<br>Unit.   |
|                           | DO 64-point Termi-<br>nal                 | Outputs 64 contacts from 64-point Output Unit.  |
|                           | DI 16-point/Do<br>16-point Terminal       | Inputs and outputs 16 contacts each from 16-point Input/16-point Output Units.  |
| Analog I/O<br>(See note.) | AI 4-point Terminal<br>(PTS51)            | Inputs 4 analog signals from CJ1W-<br>PTS51 (Isolated-type Thermocouple<br>Input Unit)  |
|                           | AI 4-point Terminal<br>(PTS52)            | Inputs 4 analog signals from CJ1W-<br>PTS52 (Isolated-type Temperature Resis-<br>tance Input Unit).   |
|                           | Al 2-point Terminal<br>(PTS15/16, PDC15)  | Inputs 2 analog signals from CJ1W-<br>PTS15 (Isolated-type Thermocouple<br>Input Unit), CJ1W-PTS16 (Isolated-type<br>Temperature Resistance Input Unit), or<br>CJ1W-PDC15 (Isolated-type DC Input<br>Unit). |
|                           | AI 8-point Terminal<br>(AD081)            | Inputs 8 analog signals from the CJ1W-<br>AD081(-V1).   |
|                           | AO 8-point Terminal<br>(DA08V/C)          | Outputs 8 analog signals from the CJ1W-<br>DA08V/DA08C.   |
|                           | AI 4-point Terminal<br>(AD041)            | Inputs 4 analog signals from the CJ1W-<br>AD041(-V1).   |
|                           | AO 4-point Terminal<br>(DA041)            | Outputs 4 analog signals from the CJ1W-<br>DA041(-V1).  |
|                           | AO 2-point Terminal<br>(DA021)            | Outputs 4 analog signals from the CJ1W-<br>DA021.   |
|                           | AI 4-point/AO 2-point<br>Terminal (MAD42) | Inputs 4 analog signals and outputs 2 an-<br>alog signals each from the CJ1W-MAD42.   |
|                           | AI 4-point Terminal<br>(DRT1-AD04)        | Inputs 4 analog signals from a DRT1-<br>AD04 DeviceNet Slave Analog Input Unit.   |
|                           | AO 2-point Terminal<br>(DRT1-DA02)        | Outputs two analog signals from a DRT1-<br>DA02 DeviceNet Slave Analog Output<br>Unit.  |
|                           | AI 4-point Terminal<br>(AD04U)            | Inputs 4 analog signals from the CJ1W-<br>AD04U.  |
|                           | AI 4-point Terminal<br>(PH41U)            | Inputs 4 analog signals from the CJ1W-<br>PH41U.  |

Note: The Function Blocks dealing with high-speed operation (operation cycle: 0.01, 0.02, and 0.05 seconds is possible).

Note: 1. The Function Blocks dealing with high-speed operation (operation cycle: 0.01, 0.02, and 0.05 seconds is possible).

2. Cannot be used with the CJ1G-CPU45P-GTC.

Note: The CX-Process functions that can be used depend on the version. For details, refer to the *operation manuals* (Cat. No.: W372-E1-□ and W373-E1-□).

Note: 1. Windows Vista 64-bit version and XP x64 Edition are not supperted.

2. Peripheral Bus cannot be used when FinsGateway V3 is used.

## **Connections to PLC**

The following 4 methods can be used to connect to a PLC.

|                 | Communications network   |   | Communication driver                      | r          |  |
|-----------------|--|---|---|------------|--|
|                 |  | FinsGateway V3                                    | FinsGateway Version<br>2003 (See note 1.) | CX-Server  |  |
| Host Link       | Connection via PLC's peripheral port or  | Supported. (Serial Unit                           | version is used.)                         | Supported. |  |
| Peripheral Bus  | ipheral Bus RS-232C port   |   | Supported.                                | Supported. |  |
| Controller Link | Connection to PLC with Controller Link Unit<br>via Controller Link Support Board (PCI<br>board). | Supported. (See note 2<br>(CLK (PCI) version is u |   | Supported. |  |
|                 | Connection to PLC with Controller Link Unit via Controller Link Support Board (ISA board).       | Supported. (CLK (ISA)                             | version is used.)                         | Supported. |  |
| Ethernet        | Connection to PLC with Ethernet Unit via<br>Ethernet Board.                                      | Supported. (Ethernet v                            | ersion is used.)                          | Supported. |  |

Note: 1. The Windows 2000 and XP operating systems are supported. (Windows 95, 98, and Me are not supported.)

2. The Windows 95 operating system cannot be used.

### **Utility Software**

## **Touch Panel Software**

#### ■ Face Plate Auto-Builder for NS

Simply specify the CSV tag file created using the CX-Process Tool to automatically create a project constructed with a Face Plate for Loop-control CPU Units for use with OMRON's NS-series Programmable Terminals.

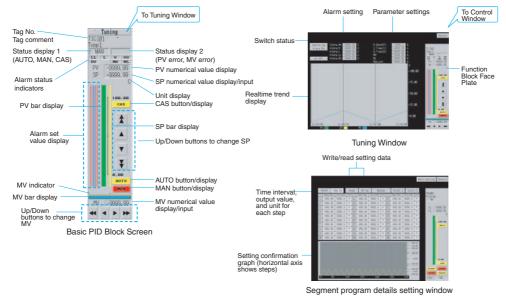

#### Function Overview

- Create windows for monitoring and tuning PID and other function blocks for up to 100 loops (NS System version 4 or higher).
- NS project files for monitoring multiple Loop-control CPU Units from a single NS-series PT can be generated from CX-Process projects for up to 32 multiple nodes.
- When a Segment Program 2 or 3 function block is used for program operation, the Detailed Setting Windows (Time Interval vs. Output Value Setting Window, Wait Interval Setting Window) used for the parameter settings are also automatically generated.
- NS-Runtime is supported.

#### **Basic Specifications**

**Basic Configuration Units** 

#### ■ Connector Cables for Built-in I/O in CJ1M-CPU□2 CPU Unit

The connector for built-in I/O in the CJ1M-CPU21/22/23 is not included.

Purchase one of the connectors or connector cables in the following table separately.

| Product name  |   |                                   | Specifications                 |                     | Model         | Stan-<br>dards |

#### **Controller Link Units, Old Models**

New models are fully compatible with old models and provide enhanced functionality, such as an increase in the number of send words from 1,000 to 4,000 words. Select a new model when ordering.

| Unit<br>classifi-         | Product<br>name         |   | Specificati                            | ons               |  | No. of unit<br>numbers |      | nt con-<br>ion (A) | Model         | Standards        |
|---------------------------|-------------------------|---|--|-------------------|--|------------------------|------|--------------------|---------------|------------------|
| cation                    |                         | Communica-<br>tions cable                             | Communi-<br>cations<br>type            | Duplex<br>support | Max. Units<br>mountable<br>per CPU<br>Unit | allocated              | 5 V  | 24 V               |               |                  |
| CJ1<br>CPU<br>Bus<br>Unit | Controller<br>Link Unit | Wired shielded<br>twisted-pair cable<br>(See note 2.) | Data links<br>and mes-<br>sage service | No                | 8  | 1                      | 0.35 |                    | CJ1W-CLK21-V1 | UC1, N, L,<br>CE |

Note: Use the following special cable for shielded, twisted-pair cable.

ESVC0.5 x 2C-13262 (Bando Electric Wire: Japanese Company)

• ESNC0.5 x 2C-99-087B (Nihon Electric Wire & Cable Corporation: Japanese Company)

• ESPC 1P x 0.5 mm<sup>2</sup> (Nagaoka Electric Wire Co., Ltd: Japanese Company)

• Li2Y-FCY2 x 0.56qmm (Kromberg & Schubert, Komtec Department: German Company)

• 1 x 2 x AWG-20PE+Tr.CUSN+PVC (Draka Cables Industrial: Spanish Company)

• #9207 (Belden: US Company)

#### **Repeater Units**

| Unit classification              | Specifications                              | Model      | Standards |
|----------------------------------|---|------------|-----------|
| Controller Link<br>Repeater Unit | Wire-to-wire Model                          | CS1W-RPT01 | UC1, CE   |
|                                  | Wire-to-Optical (H-PCF) Model (See note 2.) | CS1W-RPT02 |           |
|                                  | Wire-to-Optical (GI) Model (See note 3.)    | CS1W-RPT03 |           |

Note: 1. Using Repeater Units enables T-branches and long-distance wiring for Wired Controller Link networks. 62-node configurations, and converting part of the network to optical cable.

2. When using wire-to-optical (H-PCF) cable, use a H-PCF cable (for both Controller Link and SYSMAC LINK) or a H-PCF optical fiber cable with connector.

3. When using wire-to-optical (GI) cable, use a GI optical cable (for Controller Link).

#### **Relay Terminal Block**

| Unit classification                                       | Specifications                                  | Model      | Standards |
|---|---|------------|-----------|
| Relay Terminal Block<br>for Wired Controller<br>Link Unit | Use for Wired Controller Link Units (set of 5). | CS1W-TB101 |           |
| ৰ <u>ৰ</u> ৰ<br>মানাম                                     |   |            |           |

Note: Controller Link Units can be replaced without stopping the communications of the entire network if a Relay Terminal Block is installed in advance on the Unit in a Wired Controller Link network. Relay Blocks cannot be used on Controller Link Support Boards.

## **Serial Communications Units**

Note: 1. The Serial Gateway function is enabled only for Serial Communications Units of unit version 1.2 and later.

2. The no-protocol function is enabled only for Serial Communications Units of unit version 1.2 and later (and a CPU Unit of unit version 3.0 or later is also required).

3. The Modbus-STU Slave function is enabled only for Serial Communications Units of unit version 1.3 and later.

4. When an NT-AL001 RS-232C/RS-422A Conversion Unit is used, this value increases by 0.15 A/Unit. When a CJ1W-CIF11 RS-422A Conversion Unit is used, it increases by 0.04 A/Unit.

Note: As of July 2008, the image memory has been increased to 60 MB. Production of the NS5-□Q0□(B)-V2 and NSH5-SQ□00B-V2 is scheduled to be discontinued with a transition period of one year.

#### ■ NS-Runtime

| Model name | Specifications                              |             | Media | Model number | Standards |
|------------|---|-------------|-------|--------------|-----------|
| NS-Runtime | NS-Runtime Installer, manual in PDF format, | 1 license   | CD    | NS-NSRCL1    |           |
|            | hardware key (See note.)                    | 3 licenses  |       | NS-NSRCL3    |           |
|            |   | 10 licenses |       | NS-NSRCL10   |           |

Note: A hardware key (USB dongle) is required to run NS-Runtime.

## **Ordering Information**

#### International Standards

- The standards are abbreviated as follows: U: UL, U1: UL (Class I Division 2 Products for Hazardous Locations), C: CSA, UC: cULus, UC1: cULus (Class I Division 2 Products for Hazardous Locations), CU: cUL, N: NK, L: Lloyd, and CE: EC Directives.
- Contact your OMRON representative for further details and applicable conditions for these standards.

#### **EMC Directives**

#### Applicable Standards EMI: EN 61000-6-4 EMS: EN 61131-2 and EN 61000-6-2 (See note.)

PLCs are electrical devices that are incorporated in machines and manufacturing installations. OMRON PLCs conform to the related EMC standards so that the devices and machines into which they are built can more easily conform to EMC standards. The actual PLCs have been checked for conformity to EMC standards. Whether these standards are satisfied for the actual system, however, must be checked by the customer.

EMC-related performance will vary depending on the configuration, wiring, and other conditions of the equipment or control panel in which the PLC is installed. The customer must, therefore, perform final checks to confirm that the overall machine or device conforms to EMC standards.

Note: The applicable EMS standard depends on the product.

#### Low Voltage Directive

#### Applicable Standard: EN 61131-2

Devices that operate at voltages from 50 to 1,000 VAC or 75 to 150 VDC must satisfy the appropriate safety requirements. With PLCs, this applies to Power Supply Units and I/O Units that operate in these voltage ranges.

These Units have been designed to conform to EN 61131-2, which is the applicable standard for PLCs.

Please read and understand this catalog before purchasing the product. Please consult your OMRON representative if you have any questions or comments.

#### Warranty and Limitations of Liability

#### WARRANTY

OMRON's exclusive warranty is that the products are free from defects in materials and workmanship for a period of one year (or other period if specified) from date of sale by OMRON.

OMRON MAKES NO WARRANTY OR REPRESENTATION, EXPRESS OR IMPLIED, REGARDING NON-INFRINGEMENT, MERCHANTABILITY, OR FITNESS FOR PARTICULAR PURPOSE OF THE PRODUCTS. ANY BUYER OR USER ACKNOWLEDGES THAT THE BUYER OR USER ALONE HAS DETERMINED THAT THE PRODUCTS WILL SUITABLY MEET THE REQUIREMENTS OF THEIR INTENDED USE. OMRON DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED.

#### LIMITATIONS OF LIABILITY

OMRON SHALL NOT BE RESPONSIBLE FOR SPECIAL, INDIRECT, OR CONSEQUENTIAL DAMAGES, LOSS OF PROFITS OR COMMERCIAL LOSS IN ANY WAY CONNECTED WITH THE PRODUCTS, WHETHER SUCH CLAIM IS BASED ON CONTRACT, WARRANTY, NEGLIGENCE, OR STRICT LIABILITY.

In no event shall the responsibility of OMRON for any act exceed the individual price of the product on which liability is asserted. IN NO EVENT SHALL OMRON BE RESPONSIBLE FOR WARRANTY, REPAIR, OR OTHER CLAIMS REGARDING THE PRODUCTS UNLESS OMRON'S ANALYSIS CONFIRMS THAT THE PRODUCTS WERE PROPERLY HANDLED, STORED, INSTALLED, AND MAINTAINED AND NOT SUBJECT TO CONTAMINATION, ABUSE, MISUSE, OR INAPPROPRIATE MODIFICATION OR REPAIR.

#### **Application Considerations**

#### SUITABILITY FOR USE

OMRON shall not be responsible for conformity with any standards, codes, or regulations that apply to the combination of the product in the customer's application or use of the product.

Take all necessary steps to determine the suitability of the product for the systems, machines, and equipment with which it will be used.

Know and observe all prohibitions of use applicable to this product.

NEVER USE THE PRODUCT FOR AN APPLICATION INVOLVING SERIOUS RISK TO LIFE OR PROPERTY WITHOUT ENSURING THAT THE SYSTEM AS A WHOLE HAS BEEN DESIGNED TO ADDRESS THE RISKS, AND THAT THE OMRON PRODUCT IS PROPERLY RATED AND INSTALLED FOR THE INTENDED USE WITHIN THE OVERALL EQUIPMENT OR SYSTEM.

#### **PROGRAMMABLE PRODUCTS**

OMRON shall not be responsible for the user's programming of a programmable product, or any consequence thereof.

#### Disclaimers

#### **CHANGE IN SPECIFICATIONS**

Product specifications and accessories may be changed at any time based on improvements and other reasons. Consult with your OMRON representative at any time to confirm actual specifications of purchased product.

#### **DIMENSIONS AND WEIGHTS**

Dimensions and weights are nominal and are not to be used for manufacturing purposes, even when tolerances are shown.

#### **PERFORMANCE DATA**

Performance data given in this catalog is provided as a guide for the user in determining suitability and does not constitute a warranty. It may represent the result of OMRON's test conditions, and the users must correlate it to actual application requirements. Actual performance is subject to the OMRON Warranty and Limitations of Liability.
